

EXP-RCOND exp3 — the blocker is removed; the promotion gate is still not met

Do not read the left panel as a win for per-camera R_{cond} . It is not that gate. With the belief repaired, per-camera moves MNLL by -0.039 nats against the pooled constant (v2: +1.221), and pooled remains closer to nominal at 95% coverage (0.917 vs 0.900). Gate R5 — “beat pooled covariance on held-out evidence” — is a TIE, and the registry records no promotion. $n = 1425$ detections.
