

The setup: a camera does not measure position equally well everywhere

Four fixed cameras 6.1 m up on the north and south walls, tilted down. Pure geometry from the world file — no detector, no filter, no ground truth. Racks are not treated as blocking, so real coverage is worse than shown.

**Evenly spaced pixels do not land evenly on the floor
so one pixel is worth 9 mm here and 39 mm at the far end**

**The same thing across the real warehouse
grey = no camera has a view at all**
